INTRODUCTION

Dashboard Overview

- The Real Estate Sales Performance Dashboard provides a detailed overview of property sales and business performance.
- It helps in analyzing important metrics such as total sales, net sales, leads, and expenses.
- The dashboard presents the data in a clear and interactive format using Power BI visuals.

Sales and Performance Analysis

- The dashboard shows monthly sales trends and city-wise revenue to understand market performance.
- It helps identify which cities generate the highest revenue and how sales change over time.
- This analysis supports better planning and business decision-making.

Agent and Customer Insights

- The dashboard also analyzes agent performance to identify top-performing agents.
- It provides customer insights based on customer type, income slab, and purchasing behavior.
- These insights help businesses understand customers and improve sales strategies.

If you want, I can also help you create **3 professional points specifically for PPT presentation** (which wi

Dashboard Objectives

Key Metrics

This dashboard highlights important business metrics such as **Total Sales, Net Sales, Total Leads, and Total Expenses**.
It also shows **Net Profit, Total Units Sold, and Customer Count** to measure overall business performance.
These metrics help in quickly understanding the **financial performance and growth of the real estate business**.

Data Dimensions

The dashboard analyzes data based on different dimensions such as **City, Property Type, Agent Level, and Customer Segment**.
It also includes **Month, Year, Income Slab, and Family Size** to understand trends and patterns.
These dimensions help in performing **detailed analysis and comparison across different categories**.

Strategic Purpose

The main purpose of this dashboard is to **analyze sales performance and identify business trends**.
It helps management **track revenue, evaluate agent performance, and understand customer behavior**.
The insights from the dashboard support **better decision-making and business strategy planning**.

Tools and Technologies Used

EXCEL & POWER BI

Microsoft Excel serves as the primary data collection and preliminary analysis platform, providing robust data management and formula-based calculations. Power BI functions as the core visualization engine, delivering interactive dashboards with real-time data refresh capabilities.

Integration & Benefits

These tools are integrated to enable seamless data flow, automated reporting, and dynamic insight generation.
The combination of Excel and Power BI allows for comprehensive data handling from source to visualization while maintaining data integrity and accessibility for stakeholders at all levels.

Data Tranformation and Cleaning Steps

1. Data Import
   - Import the dataset into **Power BI Desktop** from Excel/CSV files.
   - Verify that all tables such as **Property, Agent, Customer, and Sales** are loaded correctly.
   - Check the data preview to understand the structure of the dataset.

2. Removing Unnecessary Columns
   - Identify columns that are **not useful for analysis**.
   - Remove unwanted or duplicate columns from the dataset.
   - This helps to **reduce data size and improve performance**.

3. Handling Missing Values
   - Check for **blank or null values** in important columns.
   - Replace missing values with appropriate values or remove the rows if necessary.
   - This ensures **accurate and reliable analysis**.

4. Changing Data Types
   - Verify and correct the **data types** of columns such as Date, Text, and Numeric values.
   - Convert columns like **Sales, Profit, and Expenses** into numeric format.
   - This helps Power BI perform **accurate calculations and aggregations**.

Data Tranformation and Cleaning Steps

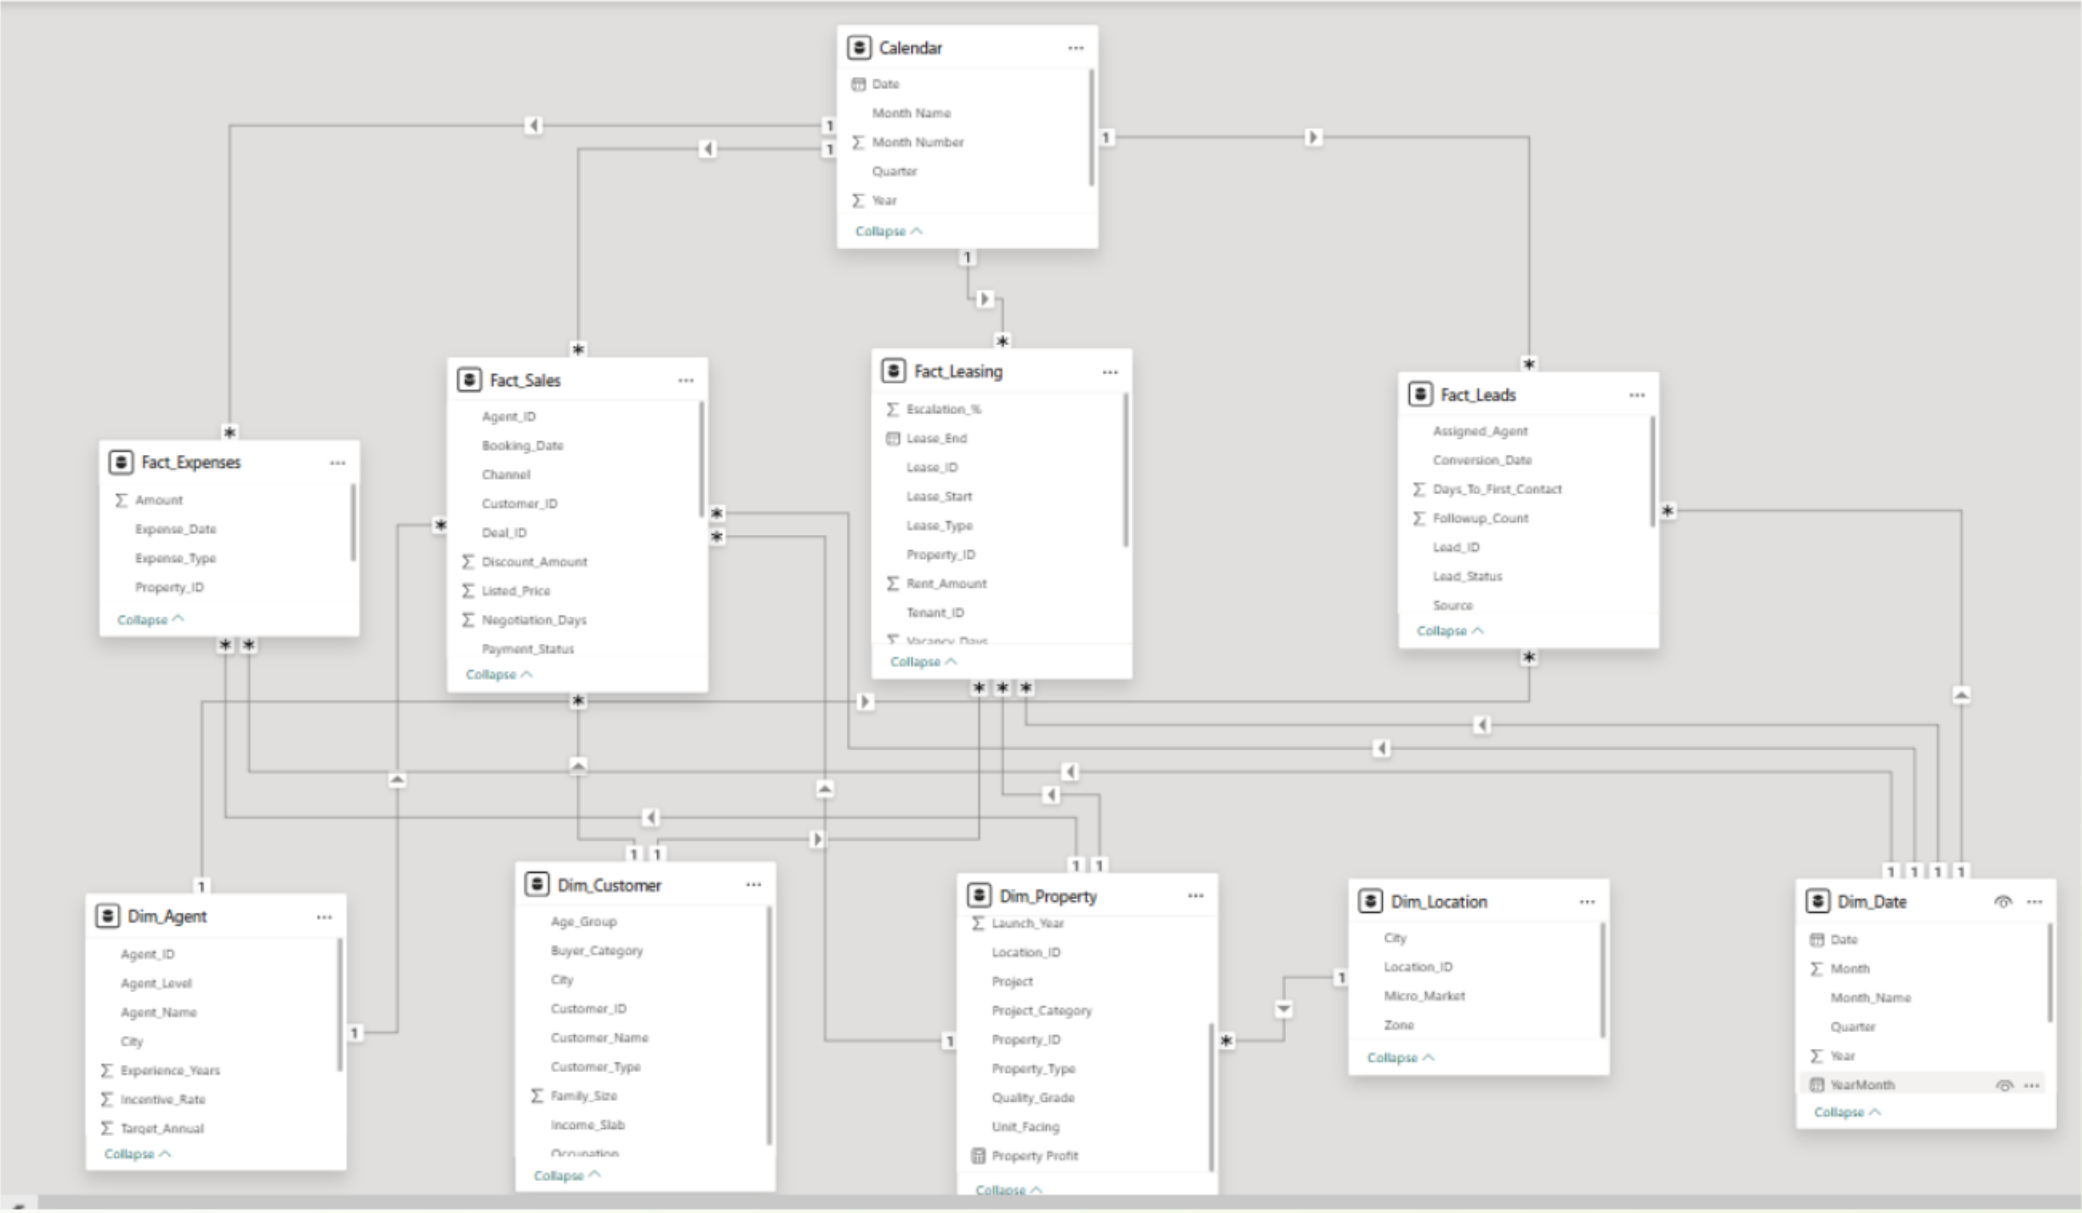
5. Removing Duplicates
- Check the dataset for **duplicate records**.
- Use the **Remove Duplicates** option in Power Query to clean the data.
- This ensures the dataset contains **only unique and valid records**

6. Creating New Columns
- Create calculated columns if required for analysis.
- Example: **Total Profit = Total Sales – Expenses**.
- These columns help in generating **better insights and visualizations**.

7. Formatting and Standardizing Data
- Standardize text fields such as **City names, Agent names, and Property types**.
- Ensure consistent naming conventions across the dataset.
- This avoids confusion during filtering and analysis.

8. Loading Clean Data
- After completing all transformations, click **Close & Apply** in Power Query.
- The cleaned data is then loaded into the **Power BI data model** for creating visuals.

Data Modeling



Dimensional Model Architecture

01

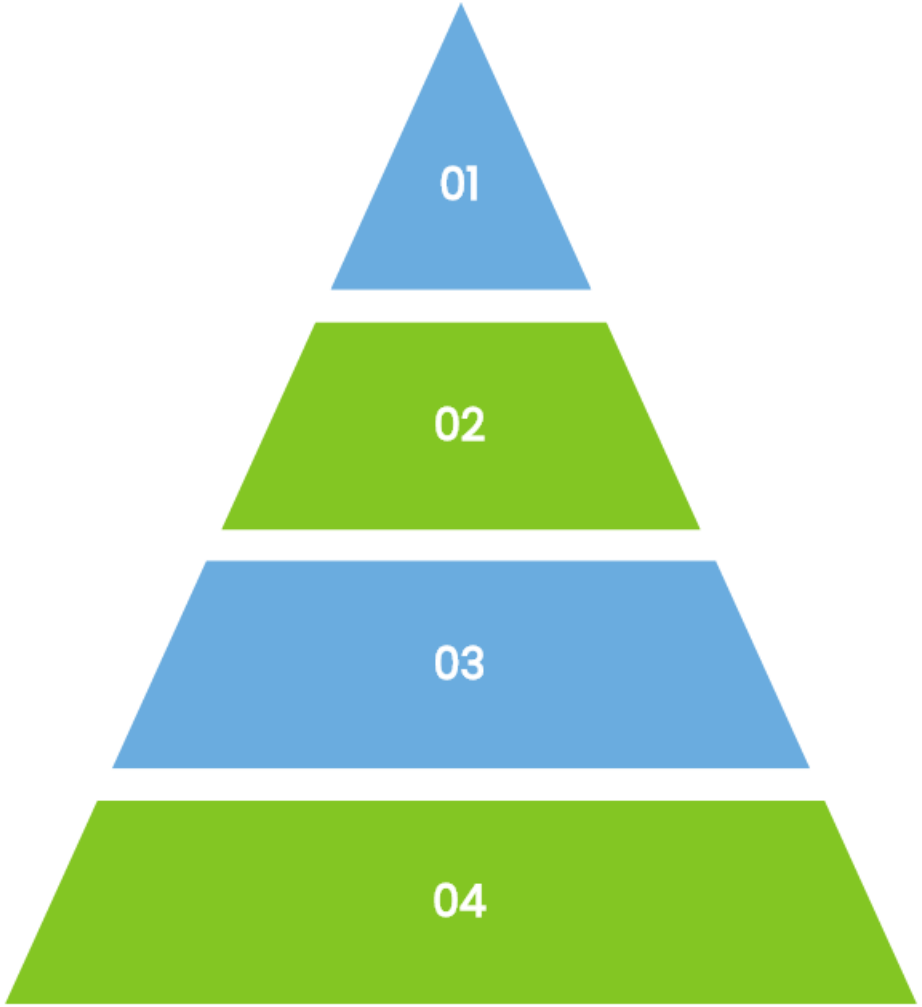
Star Schema Structure

The data model employs a star schema architecture with a central fact table for sales transactions.

02

Dimension Tables

Product Dimension (Property characteristics: BHK, furnishing status, category premium/affordable/mid-range)
Agent Dimension (agent names, levels: Expert/Senior/Junior, performance metrics)
Customer Dimension (customer segments, income slabs, age groups, occupation, family size)
Location Dimension (cities: Delhi, Mumbai, Bangalore, Pune)
Time Dimension (monthly, quarterly, yearly hierarchies for trend analysis)



03

Fact Table

The fact table aggregates measures including Total Sales, Net Profit, Discounts, and Transaction Count.

04

Analysis

This multi-dimensional structure enables flexible querying and analysis across all business perspectives.

Metrics and KPI Calculations

01 FIRST

Key Performance Indicators

Key Performance Indicators are computed from the dimensional model: Year-to-date (YTD) Sales calculated as cumulative sum of monthly transactions; Month-to-date (MTD) values updated in real-time for current performance tracking; Year-over-Year (YOY) growth rates comparing current year metrics against prior year equivalents.

02 SECOND

Agent Performance Metrics

Agent Performance Metrics include Sales Per Agent (average and individual), Agent Lead Conversion Rates (leads generated versus closed sales), and Customer Acquisition Cost.

03 THIRD

Customer Metrics

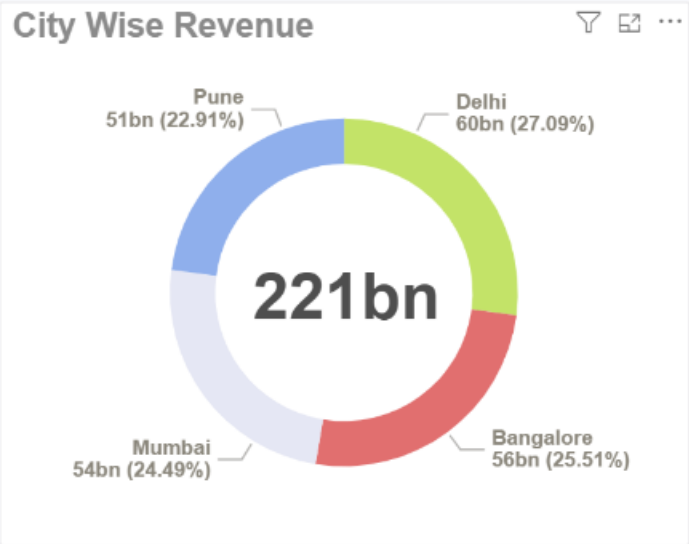
Customer metrics include Customer Lifetime Value, repeat purchase frequency, and segmentation profitability analysis.

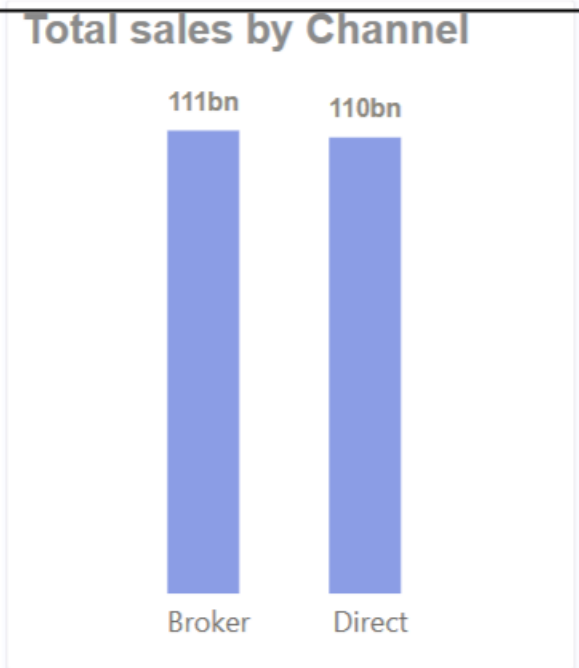
04 FOURTH

Property-level Metrics

Property-level metrics calculate Net Profit (Total Sales minus Total Expenses), Average Rent per property, and ROI by property type.

Overview High-Level KPI Summary





Executive Performance

Real Estate Executive Overview (Refresh Timestamp: 02-03-2026 10:39:37) presents consolidated performance metrics: Total Sales: 221bn across all properties and channels; Net Sales: 210bn after deductions; Total Leads: 18,000 qualified prospects; Total Expenses: 316M operational costs.

Geographic Market Distribution

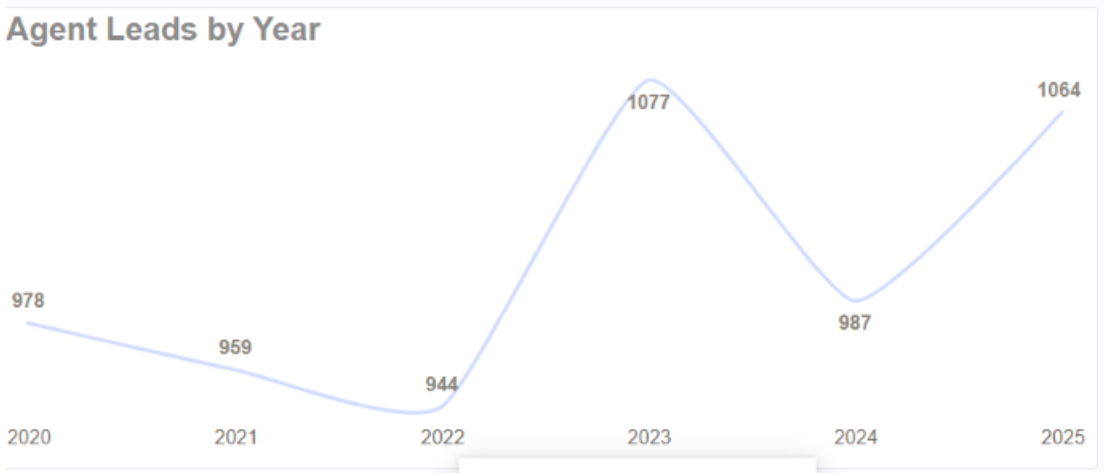
Sales are distributed across geographic markets: Delhi: 111bn (50.2% of revenue), Mumbai: 56bn (25.3%), Bangalore: 54bn (24.4%), with additional markets contributing to the citywise diversified revenue base.

Portfolio & Channel Performance

Revenue by Project highlights top performers: Elite Residency: 2.4bn, Urban Heights: 2.3bn, Sky Tower: 2.3bn, Palm Meadows: 2.1bn, Green Valley: 2.1bn, demonstrating balanced portfolio contribution. Sales Channel Distribution shows Broker channel generating 60bn (27.1%), Direct channel 51bn (23.0%), and Customer channel contributing significant volume.

Agent Performance Rankings and Sales Trends

Agent Name	Net Profit (bn)
Rohit Mehta	14
Kiran Sharma	14
Kiran Mehta	13
Anjali Mehta	10
Pooja Verma	10



Net Profit by Agent Name

Rohit Mehta: 14bn, Kiran Sharma: 14bn, Kiran Mehta: 13bn, Anjali Mehta: 10bn, Pooja Verma: 10bn

Monthly Sales Trend Analysis

March: 19.2bn, April: 14bn (representing month-end adjustment), May: 19.0bn, June: 19.9bn demonstrating recovery and sustained momentum. These metrics enable management to identify top-performing agents for incentive allocation and to recognize seasonal patterns for workforce planning. Agent-level sales data supports individual performance review conversations and compensation adjustments aligned with contribution.

Property Portfolio Metrics

Performance Overview

Property Performance Analysis (Refresh: 02-03-2026 10:39:37) presents comprehensive property-level insights: Total Rent across portfolio: 628M monthly recurring revenue; Property Profit aggregated: 210bn annual profitability; Expenses per property: 1,59,059 average monthly operational costs; Average rent per property: 52,371 standard rental rate.

Year-to-Date Metrics

Year-to-date metrics show: All YOY comparison: 37bn current year equivalent, YTD 3bn, MTD 37bn.

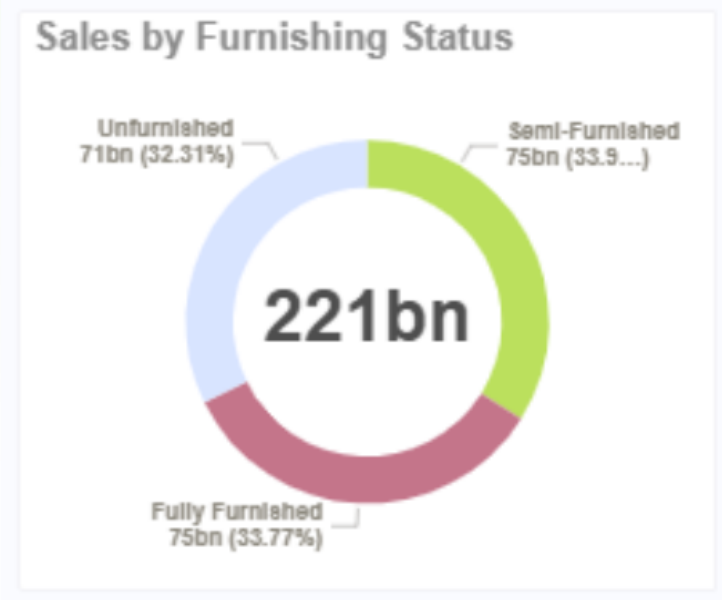
Expense Distribution

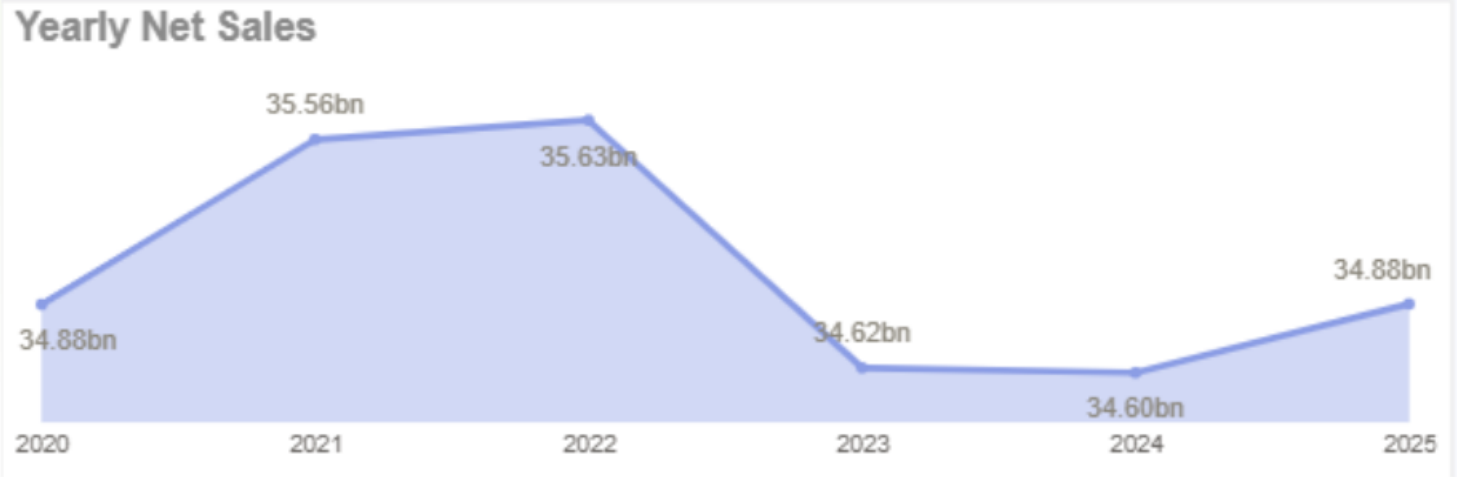
Project Category Wise Expenses breakdown: Premium projects: 35.56bn, Affordable segment: 34.88bn, Mid-range category: 34.62bn, demonstrating balanced expense distribution across product segments. These metrics enable property managers to identify underperforming assets requiring intervention and to benchmark operational efficiency.

Metric	Value
Total Rent (Monthly Recurring Revenue)	628M
Property Profit (Annual)	210bn
Expenses per Property (Average Monthly)	1,59,059
Average Rent per Property	52,371

Project Category	Expenses (bn)
Premium Projects	35.56
Affordable Segment	34.88
Mid-range Category	34.62

Rental & Furnishing Analysis





Yearly Net Sales Trend

Yearly Net Sales demonstrates historical growth: 2020: 34.60bn, 2021: 34.62bn, 2022: 34.88bn, 2023: 35.56bn, 2024: 35.63bn, 2025: 35.56bn, showing steady state with slight volatility.

Furnishing Status Market

Sales by Furnishing Status reveals market preferences: Unfurnished properties: 0.07T volume, 71bn (32.3% of revenue); Semi-Furnished: 0.21T volume; Fully Furnished: 0.07T volume, 75bn (33.8% of revenue), indicating slight premium for fully furnished units.

Strategic Insights

Property Profit by Property Type and Sales Distribution Quality Grade provides further granularity. These insights guide inventory management decisions and pricing strategies aligned with customer preferences for furnishing levels and property categories.

Top Customer Profiles

Top Performing Customers

Kiran Iyer: 3.2bn cumulative purchases, Rohit Sharma: 3.2bn, Suresh Reddy: 3.1bn, Amit Gupta: 2.9bn, representing high-value repeat customers and relationship anchors.

Family Size Wise Sales

Household unit preference patterns: 36.3bn to 37.9bn range indicating consistent family-unit purchasing behavior.

Property Type & Customer

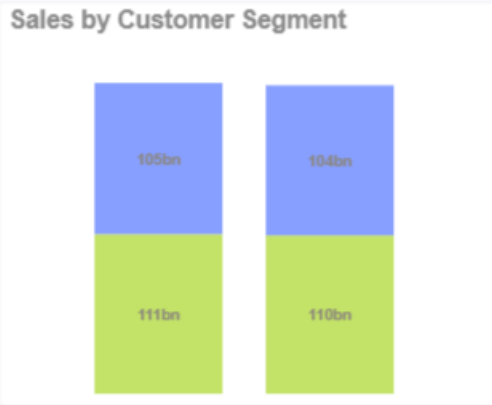
Property Type preferences and Customer Type segmentation (Property owner vs. Agent vs. Customer classification) inform inventory and marketing strategies.

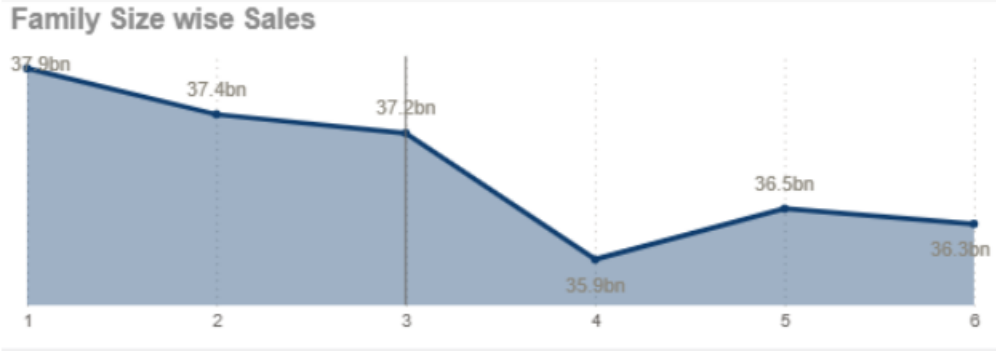
Geographic Performance

Highest Sales by City: Delhi: 60bn leading market, Bangalore: 56bn, Mumbai: 54bn, Pune: 51bn, totaling 221bn revenue and aligning with national real estate growth corridors.

Customer Name	Cumulative Purchases (bn)
Kiran Iyer	3.2
Rohit Sharma	3.2
Suresh Reddy	3.1
Amit Gupta	2.9

City	Sales (bn)
Delhi	60
Bangalore	56
Mumbai	54
Pune	51
Total	221





Interactive Features and Data

01 Dashboard Tooltips

Sales figures display full precision values (e.g., 221bn = 221,000,000,000) with currency formatting for clarity.
Agent names link to performance detail pages with historical trends and commission calculations.
Property names connect to lease terms, vacancy history, and maintenance records.
Geographic map tooltips show regional performance benchmarks and market comparisons.

02 Time Period Tooltips

YTD (Year-to-Date) represents January 1 through current date
MTD (Month-to-Date) shows current calendar month performance
YOY (Year-over-Year) compares current year against identical period prior year

03 Contextual Layers

These contextual layers enable users to verify calculations and understand metric definitions without requiring separate documentation.
